01 Select a patient

Define the screening question

USER ACTION

Search or select a synthetic patient. Review the reference date, enter a trial-related question, choose the number of candidate trials and click **Run screening**.

EXAMPLE INPUT

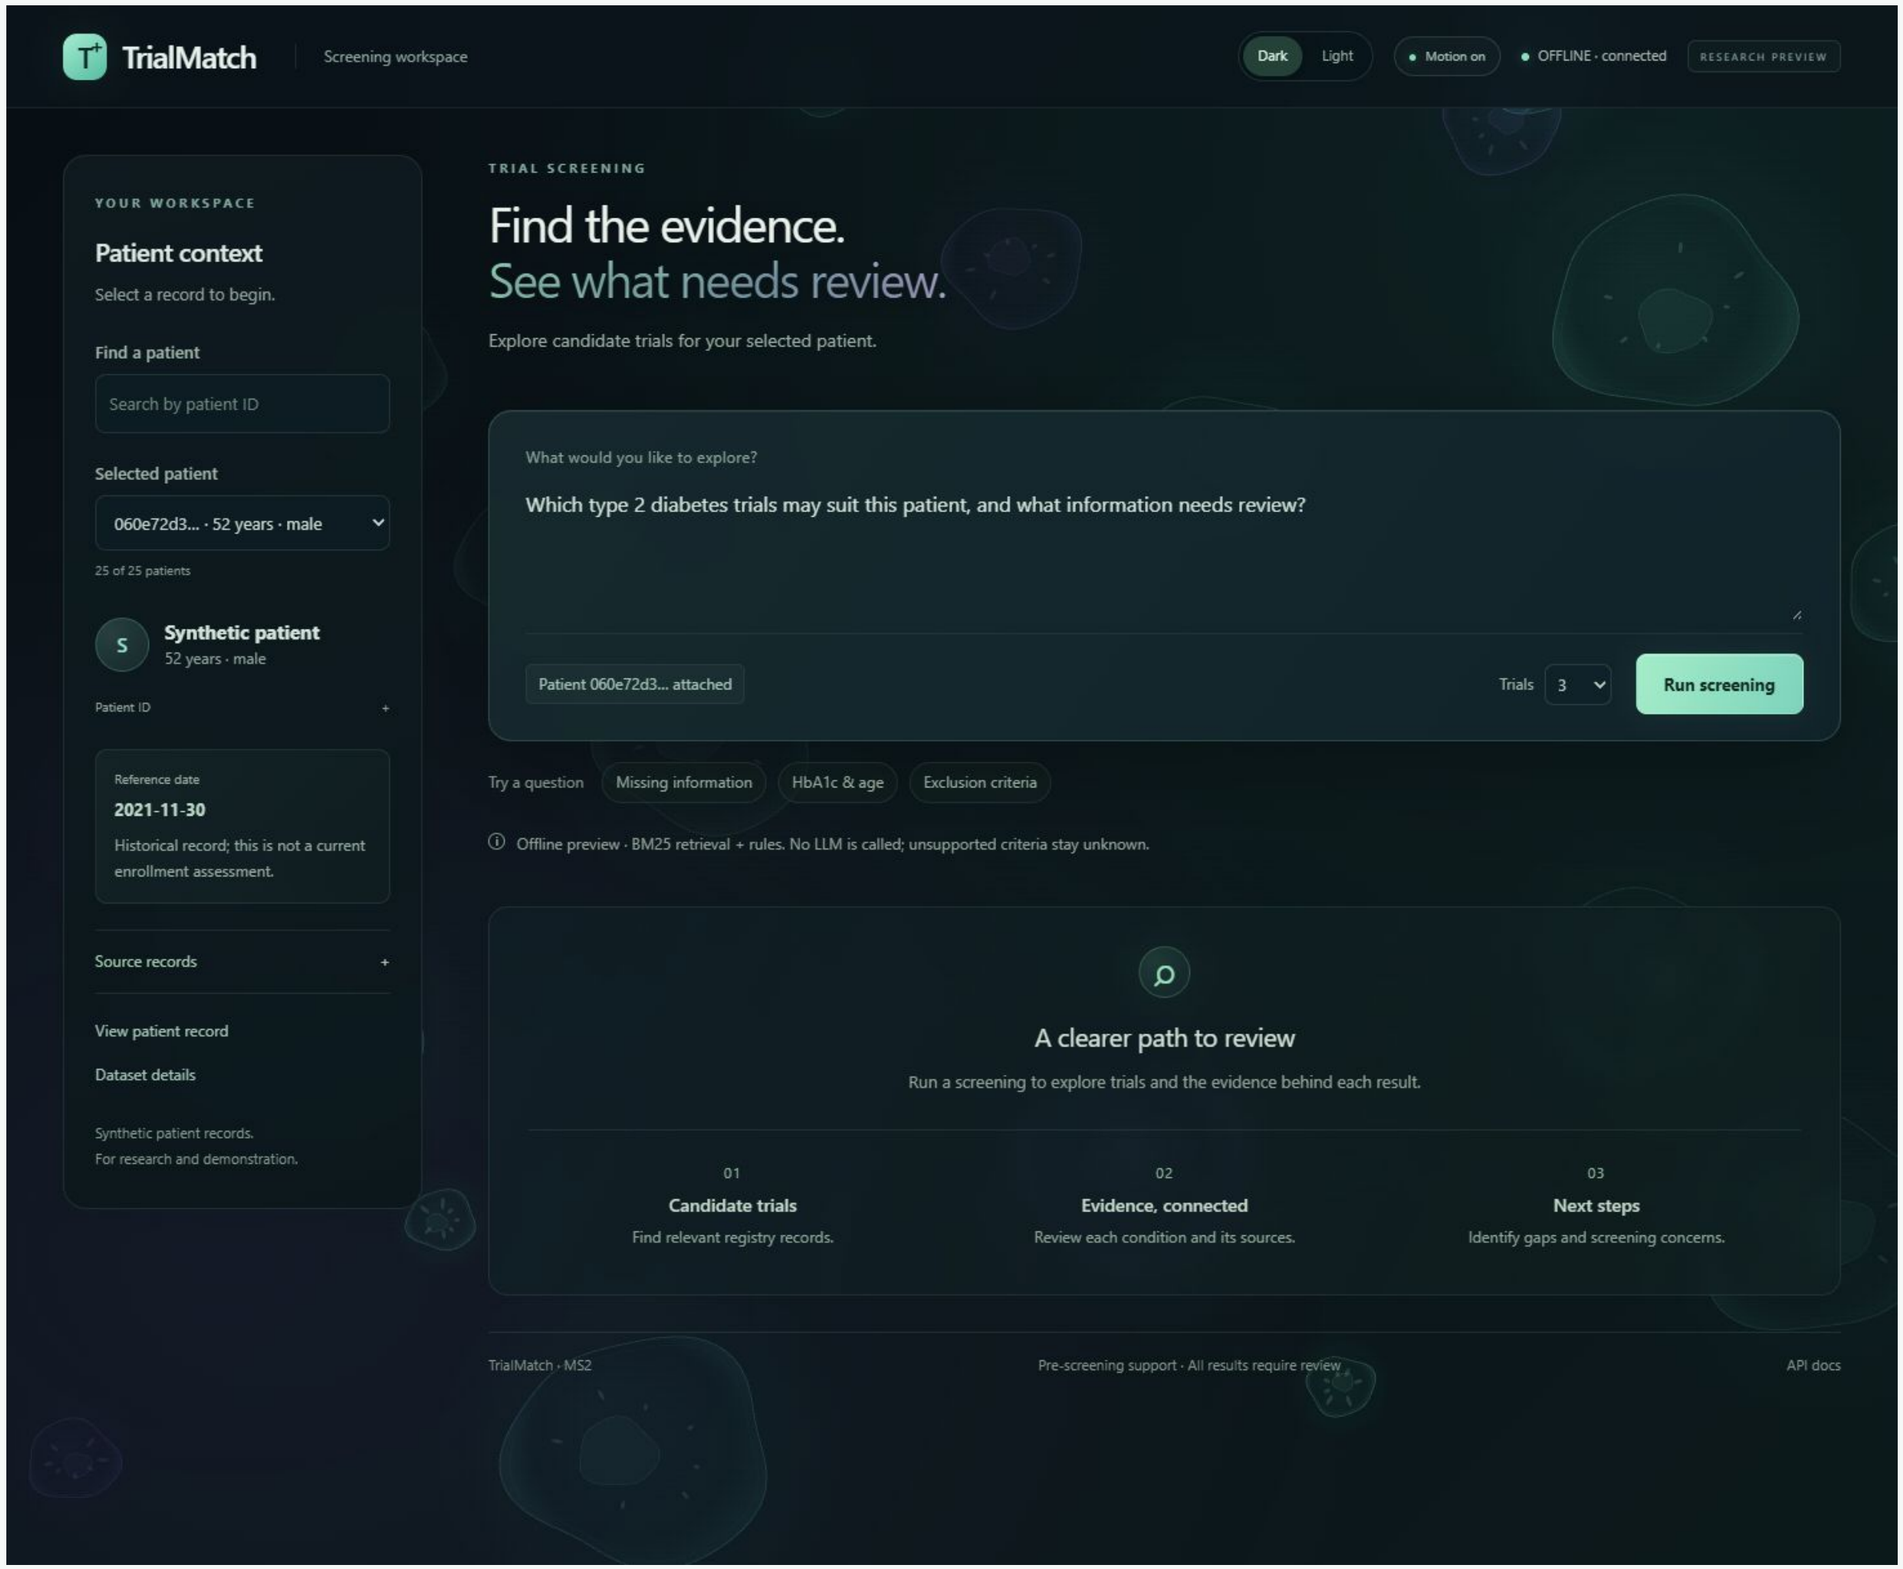

Patient: 060e72d3...
Reference date: 2021-11-30
Candidates requested: 3

INTERACTION

The left panel sets the patient context. The main panel contains the question and primary action. The empty state explains what the user will receive.

NEXT

The browser sends the patient ID, question and top_k to the screening API.

02 Review candidates

Compare results before opening details

USER ACTION

Review each candidate trial, its registry link and screening status. Expand the summary or scope notes as needed.

WHAT IS SHOWN

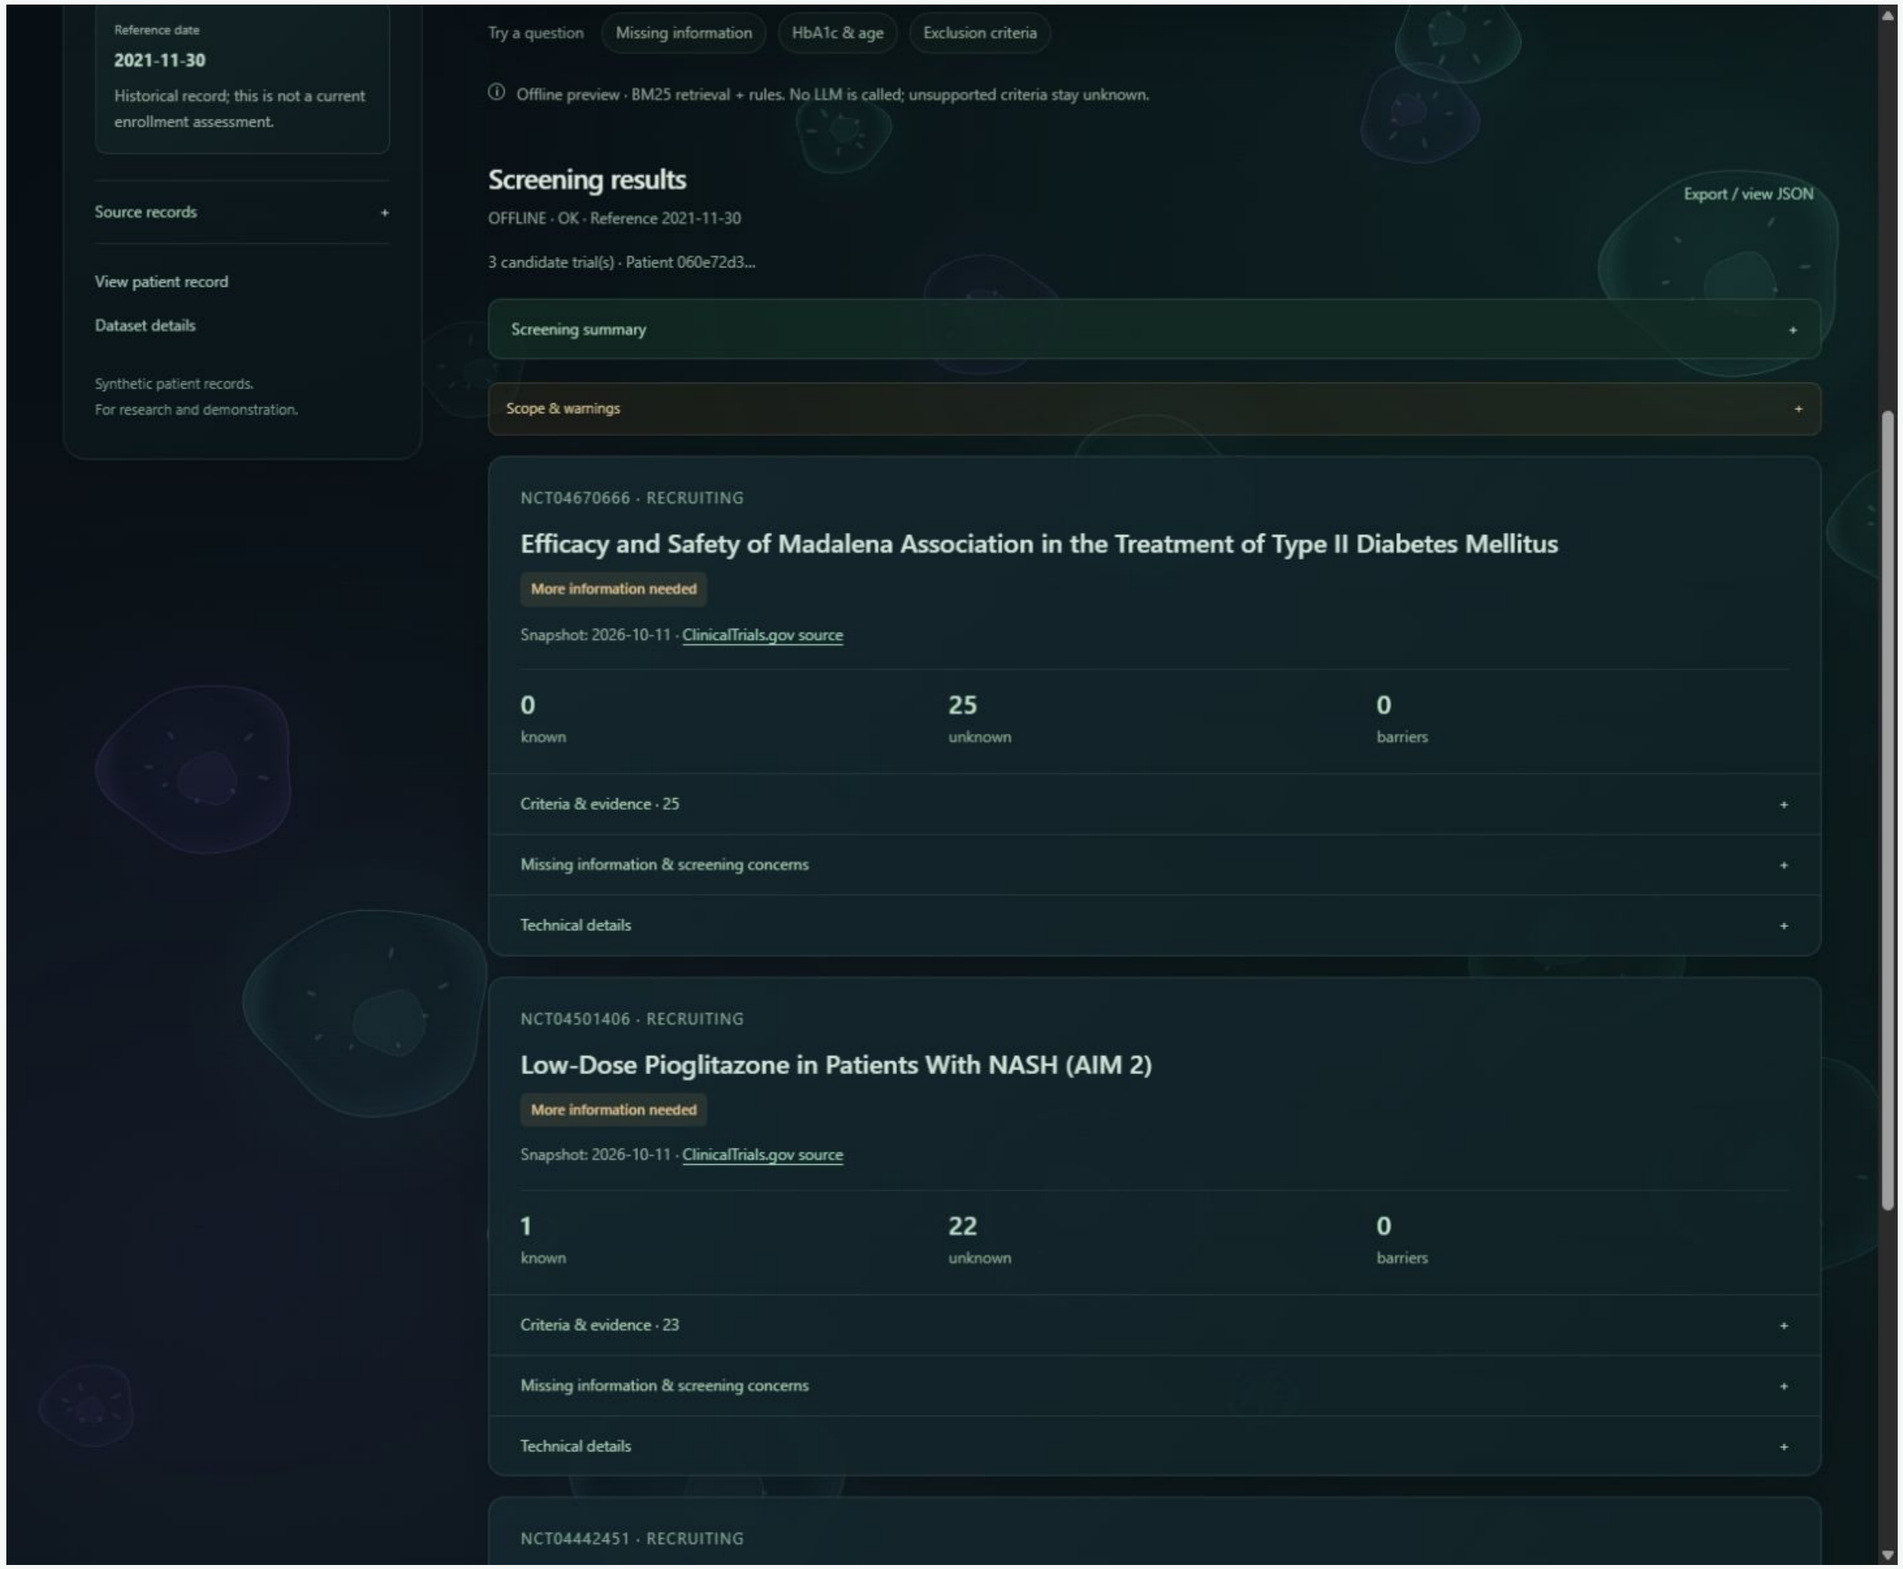

Trial cards summarize known conditions, unknown conditions and identified barriers. These are pre-screening results, not enrollment decisions.

INTERACTION

Collapsed sections keep the list readable. **Export / view JSON** lets users inspect the actual backend response.

NEXT

Open **Criteria & evidence** on a candidate trial to review individual conditions.

03 Inspect evidence

Trace a condition back to patient facts

USER ACTION

Expand **Criteria & evidence**, then open **Supporting evidence** for an assessed condition.

EXAMPLE

Trial NCT04501406 requires age 21-75. The patient is 52 at the reference date, so this inclusion criterion is MET. The source Patient record is displayed.

UNCERTAINTY

The consent condition remains UNKNOWN because this offline workflow does not interpret it. Missing or unsupported evidence must not be treated as a pass.

NEXT

Review outstanding information and return to other candidates. All results require human review.
